

Let me verify the exact portals for your six districts before I give you the list — some of these are municipality-specific.

Here's the exact source map, organized by the data fields in your Finder document. Everything verified as of today.

1. Parcels (Flurstück number, size, boundaries, coordinates)

- **opengeodata.lgl-bw.de** — the central place. ALKIS data in NAS format, downloadable package-wise per Gemarkung, containing parcel boundaries with parcel number, registered size and administrative attributes (no owner data) [lgmilde](#) — free for commercial use, attribution "Datenquelle: LGL, www.lgl-bw.de".
- For live queries instead of bulk files: the LGL's WFS services, specifically WFS_INSP_BW_Flst_ALKIS (parcels) and WFS_INSP_BW_Gebaeude_ALKIS (buildings), [LGL-Internet](#) listed on www.lgl-bw.de → Produkte → Open Data.

2. Building footprints, heights, built floors

- Same portal: 3D building data in LoD1 and LoD2 quality levels in CityGML format, requested as 2x2 km tile units. [lgmilde](#) The models are computed from ALKIS footprints plus laser-scan heights and carry geometric and technical attributes. [Rundertischgis](#) Built floors = building height ÷ ~3m — Andi derives this directly from LoD2, no separate source needed.
- Footprint also comes with the ALKIS package (Gebäude layer), so he can cross-check.

3. Zoning (GFZ, GRZ, allowed floors)

- **Stuttgart:** maps.stuttgart.de/bebauungsplaene — more than 3,500 development plans for the city area in an interactive map, [Landeshauptstadt Stuttgart](#) over 3,000 of them already INSPIRE-transformed. [daten.bw](#) This is the best-digitized municipality in your region; start here.
- **Statewide overview:** geoportal-bw.de → Themenkarte Bebauungspläne. To pull a municipality's plans as a dataset series, open the MIS GDI-BW metadata catalog, filter by type "Series", search the municipality name — you get the "XPlanung BPL" and "INSPIRE BPL" series per Gemeinde. [Geoportal BW](#)
- **Plan boundaries statewide:** geoportal-raumordnung-bw.de — the AROK register with boundary areas of all Bebauungspläne, §34/§35 BauGB Satzungen, and Flächennutzungspläne, [Geoportal-raumordnung-bw](#) with free downloads in XPlan and Shape format. [VHW](#) This tells the engine *where* a plan exists even when the GFZ values require reading the PDF.
- **Non-digitized plans:** municipality websites, search "Bebauungsplan + Gemeinde" — this stays manual extraction work for the priority municipalities (Waiblingen, Weinstadt, Filderstadt).

4. Heating / energy signals (the D-score)

- **energieatlas-bw.de** (LUBW) — this is the goldmine. It contains a detailed area analysis of heating types, retrievable down to Baublock level (blocks with at least 15 residential buildings), plus a map of the percentage of buildings supplied by district heating per area. [Landesanstalt für Umwelt Baden-Württemberg](#) Sections: energieatlas-bw.de/waerme and [waermenetze](#).
- **Wärmeatlas BW (KEA-BW):** a digital planning instrument with heat demand at building,

block and street level — available as free download at www.kea-bw.de/waermewende/angebote/downloads. [keep](#) Building-level heat demand is your best renovation-neglect proxy.

- **Kommunale Wärmepläne:** now universal — since August 2025 the federal Wärmeplanungsgesetz is implemented in BW law, making heat planning mandatory for all municipalities, [Energieatlas](#) and since January 2026 all plans are submitted centrally to the Wärmeplattform BW at the LUBW, with results presented in the Energieatlas. [Energieatlas](#) Individual plan PDFs sit on each city's website (e.g. Stuttgart's Wärmeplan on stuttgart.de).
- District heating network maps: Stuttgart Netze / EnBW publish grid areas; the Energieatlas Wärmenetze layer covers the overview.

5. Building age (E-score)

- No open registry — three proxies: the LGL's historical orthophoto WMS layers by decade (1950s through 2020s) [LGL-Internet](#) — a building present with identical footprint in the 1960s layer is verified pre-1978 stock; Zensus 2022 grid data (construction-year classes per 100m cell, free at zensus2022.de); and archived listings for spot confirmation.

6. Renovation history (C-score)

- Baugesuche/building permit notices: published in municipal Amtsblätter and Bekanntmachungen pages — search "Baugesuche + municipality". Not centralized; this is scraping work per priority municipality. Absence of any permit over decades plus high heat demand = the neglect signal.

7. Heritage protection (hard filter #1)

- Landesamt für Denkmalpflege BW (denkmalpflege-bw.de) — the Denkmalliste is **not** open data; extracts are provided on request per municipality. Some portals show it partially (the Rems-Murr Geoportal displays Kleindenkmale). Plan: request list extracts for the six districts in writing; until then treat heritage as "unknown → manual check before promote" rather than assumed clear.

8. Land values (context, not scoring)

- BORIS-BW viewer: www.gutachterausschuesse-bw.de — view free, but the data is copyright-protected and republication/commercialization is prohibited; [BORIS-BW](#) Stuttgart's own Bodenrichtwertkarte sits at gis7.stuttgart.de, with the extended paid version via the Stadtmessungsamt Kundenzentrum. [Stuttgart](#) Internal reference only until licensed.

9. County geoportals (supplementary layers)

- Rems-Murr: geoportal-rems-murr-kreis.de — parcel data, planning and environmental layers, plus county-exclusive information not available elsewhere. [Rems-Murr-Kreis](#) Landkreis Esslingen and Ludwigsburg run their own LRA GIS services; Böblingen and Göppingen route mostly through municipal viewers. These are secondary — the LGL open data covers the core fields statewide, so county portals are for gap-filling (Denkmale, local plans).
- Catalog for everything: daten-bw.de (the state open-data portal) and metadaten.geoportal-bw.de for finding any service endpoint by name.

Practical instruction for Andi: primary pipeline = opengeodata.lgl-bw.de (ALKIS + LoD2 + DOP bulk) → PostGIS, zoning from maps.stuttgart.de + Geoportal Raumordnung, heating from Energieatlas/KEA Wärmeatlas downloads. Manual/request-based side channel = Denkmallisten,

Baugesuche, non-digitized B-Pläne — these only run for objects that already scored high, not for the mass scan.

Want this as a formal source register document (source, URL, fields delivered, format, license, access method, per scan-engine module) to attach to Andi's brief? That would also double as your data-provenance documentation for the compliance file.
