

# C1 · Scouting Order

*The investor tells Antberg what to hunt. Four decisions, one order button.*

## What this screen is for

This is the first screen the client touches. It is built around how family offices and institutional investors actually think about acquisitions — strategy first, then geography, then asset type, then budget. When the order is submitted, nothing more happens on the client's side: the engine scans in the background and the catalogue arrives a few days later. The screen should feel like placing a precise order, not like filling in a form.

## What is on the screen

|                     |                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Strategy</b>     | One choice from the investment thesis list: Value Add, Buy & Hold, Fix & Flip, Core, Core Plus, Repositioning, Conversion, Development, Portfolio Aggregation, Distressed, Opportunistic, Income/Yield, Land Banking. Show the four or five most common ones openly; the rest sit behind a 'more strategies' link so the screen stays calm. The chosen strategy drives everything the engine looks for. |
| <b>Location</b>     | Country (Germany), one or more states, one or more anchor cities, and a radius around each. A small map makes this feel real. An optional exclusion field lets the client remove unwanted towns or villages — keep it behind a link, not open on the screen.                                                                                                                                            |
| <b>Asset type</b>   | Residential, Mixed-use, Commercial, Industrial/Logistics, Land. Next to it a 'never include' list for hard exclusions (e.g. no retail, no monuments, no single-family). Exclusions are a quiet secondary element, not a main block.                                                                                                                                                                     |
| <b>Ticket size</b>  | A simple range, e.g. €2M – €10M. One slider or two fields — nothing more.                                                                                                                                                                                                                                                                                                                               |
| <b>Order button</b> | One clear action. After pressing it, a short confirmation: the scan is running, the catalogue arrives in a few days. No summary panel repeating what the client just entered.                                                                                                                                                                                                                           |

## How the user moves through it

- 1 The client picks one strategy — this is the most important decision on the screen.
- 2 He sets the geography: state, anchor city, radius, and (if needed) exclusions.
- 3 He picks asset types and marks anything Antberg should never show him.
- 4 He sets the ticket range and presses Order.
- 5 He sees a calm confirmation and leaves. The next thing he experiences is the catalogue.

### Notes for the design

- One decision per block, read top to bottom. The client should never scroll back to check something.
- The full 13-strategy list exists, but only a handful are visible by default — choice, not overwhelm.
- Exclusions (places, asset types) are always secondary: links and quiet lists, never big red blocks.
- The order button is the only strong element on the page.
