

C2 · Opportunity Catalogue

The delivered list: the best ~100 objects out of ~100,000 scanned, ranked and ready to study.

What this screen is for

This is the moment Antberg proves itself. The client ordered a hunt, and this screen is the result. It must communicate two things instantly: the scale of the work done in the background, and the quality of what survived the filter. One sentence of context carries the scale; the cards carry the quality. Everything deeper belongs to the Potential Analysis, one click away.

What is on the screen

Context line	A single sentence at the top: '100 opportunities found in 100,000 scanned objects · ranked by score.' This replaces any dashboard of counters.
Opportunity cards	Around 10 per page, with paging. Each card shows only: object ID, location and asset type, the score, the ticket range, one leading signal, and an Open button. Upside bars, risk previews and confidence tags stay out of the card — they live in the analysis.
Sorting & filter	Sort by score as default. One small filter row (asset type, city) if needed — nothing that competes with the cards.
Map view (optional)	A toggle that shows the same opportunities as pins on a map. Approximate locations only — exact addresses are revealed later in the process.

How the user moves through it

- 1 The client lands here after the scan finishes (and returns here often).
- 2 He reads the context line — 100 out of 100,000 — and understands the filter he paid for.
- 3 He scans the cards, sorted by score, and opens the ones that speak to him.
- 4 Opening a card leads to the Potential Analysis (C3) for that object.

Notes for the design

- The card is a teaser, not a report. If the client can decide from the card alone, the card says too much.
- One action per card: Open. Selecting happens after reading the analysis, never from the list.
- Whitespace between cards is part of the product: a short, breathable list says 'curated' better than any label.
