

C5 · Evaluation & Offers

Mandated objects return with full documentation, a bank-level value, and everything needed to write the offer.

What this screen is for

After the mandate, Antberg's agents gather the deep material on every object. This screen is where the client sees the result: complete documentation, a defensible current value, and the market context around his whole package. It ends in action — the client, together with his own banker, prepares a written offer for each object and confirms it. The design should feel like a bank-grade data room that always points to the next step.

What is on the screen

Object list	The mandated objects, now with full documentation attached. Choosing an object opens its evaluation.
Value today	A bank-level valuation of the object as it stands — one clear number (e.g. €889,121), with the documentation behind it one click away.
Documentation	The confirmed details and papers per object, structured and complete. This is where earlier estimates become verified facts.
Market intel	One level up: how the client's whole package (e.g. all 44 objects) interacts with his strategy and with macro-economic trends. Portfolio view, not object view.
Offer preparation	Per object: the space where the client and his banker settle the offer. The offer is written, printed, and confirmed by email — the screen tracks which objects already have a confirmed offer.

How the user moves through it

- 1 The client opens an object and sees its verified value and full documentation.
- 2 He checks the market intel to see how the package behaves as a whole.
- 3 With his banker, he decides the offer per object.
- 4 He confirms each offer (print + email) — and the pipeline moves the object to the offer stage.

Notes for the design

- Two levels, clearly separated: the single object (value + documents) and the package (market intel).
- The valuation number is the hero of the object page — everything else supports it.
- Offer status per object must be visible at a glance: no offer yet / in preparation / confirmed.
