

C6 · Pipeline

Live progress on every mandated object: where it stands, what happens next, what is blocking it.

What this screen is for

The pipeline is the client's window into the work Antberg does for him. He is not the one acting here — the agent is — but he must feel fully informed and in control at every moment. Each object answers three questions at a glance: which stage it is in, what is the next step, and is anything missing. That is all the client needs; everything operational stays in the Agent View.

What is on the screen

Object rows	One generous row per mandated object: ID and location, the stage bar, one 'Next' line, and a blocker chip only when something is actually blocking.
Stage bar	Five client-friendly stages: Docs → Owner contact → Evaluation → Offer → Closing. Internally the process has more steps; the client sees the grouped, understandable version.
Next line	One sentence per object about what happens next — e.g. 'Waiting for owner reply, follow-up booked' or 'Offer ready — needs your approval'. This line is what the client actually reads.
Blockers	A quiet chip naming the missing item (e.g. 'Grundbuch extract missing'). Shown only when a blocker exists — its absence is the good news.

How the user moves through it

- 1 The client opens the pipeline and scans the stage bars — ten seconds tell him where everything stands.
- 2 He reads the Next line on the objects he cares about.
- 3 When an object needs him (e.g. approving an offer), the Next line says so clearly.
- 4 Objects that reach Closing complete his order — the loop that started in C1 closes here.

Notes for the design

- No agent initials, no timestamps, no percentages — the stage bar and the Next line say it all.
- An object that needs the client's action should stand out gently; everything else stays calm.
- The pipeline is read many times a week: optimize for the ten-second scan, not for completeness.
